

Implement a new Neural Network Regressor

The BRAPH 2 Developers

September 19, 2023

This is the developer tutorial for implementing a new neural network regressor. In this Tutorial, we will explain how to create the generator file `*.gen.m` for a new neural network regressor, which can then be compiled by `braph2genesis`. All kinds of neural network models are (direct or indirect) extensions of the base element `NNBase`. Here, we will use as examples the neural network regressor `NNRegressorMLP` (multi-layer perceptron regressor).

Contents

<i>Implementation of a Neural Network Regressor</i>	2
---	----------

Implementation of a Neural Network Regressor

We will start by implementing in detail `NNRegressorMLP`, which is a direct extension of `NNBase`. A multi-layer perceptron regressor `NNRegressorMLP` comprises a multi-layer perceptron regressor model and a given dataset.

Code 1: NNClassifierMLP element header. The header section of the generator code for `_NNRegressorMLP.gen.m` provides the general information about the `NNRegressorMLP` element.

```

1 %% iheader!
2 NNRegressorMLP < NNBase (nn, multi-layer perceptron regressor) comprises a
    multi-layer perceptron regressor model and a given dataset. ①
3
4 %%% idescription!
5 A neural network multi-layer perceptron regressor (NNRegressorMLP) comprises
    a multi-layer perceptron regressor model and a given dataset.
6 NNRegressorMLP trains the multi-layer perceptron regressor with a formatted
    inputs ("CB", channel and batch) derived from the given dataset.
```

① defines `NNRegressorMLP` as a subclass of `NNBase`. The moniker will be `nn`

Code 2: NNRegressorMLP element prop update. The `props_update` section of the generator code for `_NNRegressorMLP.gen.m` updates the properties of the `NNRegressorMLP` element. This defines the core properties of the data point.

```

72                 flattened_inputs_individual = [currentData(:);
        flattened_inputs_individual];
73             end
74         end
75     flattened_inputs_group = [flattened_inputs_group;

```

① defines NNDataset which contains the NNDatapoint to train this regressor.

② defines the compatible NNDatapoint classes with this NNRegressorMLP.

③ is a query that transforms the input data of NNDatapoint to the CB (channel-batch) format by flattening its included cells.

```

        flattened_inputs_individual'];
76     end
77     value = {flattened_inputs_group};
78 end
79
80 %%% iprop!
81 TARGETS (query, cell) constructs the targets in the CB (channel-batch)
    format.
82 %%% icalculate! ④
83 % targets = nn.get('PREDICT', D) returns a cell array with the
84 % targets for all data points in dataset D.
85 if isempty(varargin)
86     value = {};
87     return
88 end
89 d = varargin{1};
90 targets = d.get('TARGETS');
91 if isempty(targets)
92     value = {};
93 else
94     nn_targets = [];
95     for i = 1:length(targets)
96         target = cell2mat(targets{i});
97         nn_targets = [nn_targets; target(:)'];
98     end
99     value = {nn_targets};
100 end
101
102 %%% iprop!
103 MODEL (result, net) is a trained neural network model.
104 %%% icalculate! ⑤
105 inputs = cell2mat(nn.get('INPUTS', nn.get('D'))); ⑥
106 targets = cell2mat(nn.get('TARGETS', nn.get('D'))); ⑦
107 if isempty(inputs) || isempty(targets)
108     value = network();
109 else
110     number_features = size(inputs, 2);
111     number_targets = size(targets, 2);
112     layers = nn.get('LAYERS'); ⑧
113
114     nn_architecture = [featureInputLayer(number_features, 'Name', 'Input')];
115     for i = 1:length(layers)
116         nn_architecture = [nn_architecture
117             fullyConnectedLayer(layers(i), 'Name', ['Dense_' num2str(i)])
118             batchNormalizationLayer('Name', ['BatchNormalization_' num2str(i)
119             ])
120             dropoutLayer('Name', ['Dropout_' num2str(i)])
121         ];
122     end
123     nn_architecture = [nn_architecture
124         reluLayer('Name', 'Relu_output')
125         fullyConnectedLayer(number_targets, 'Name', 'Dense_output')
126         regressionLayer('Name', 'Output')
127     ];
128
129 % specify trianing options ⑨
130 options = trainingOptions( ...
131     nn.get('SOLVER'), ...
132     'MiniBatchSize', nn.get('BATCH'), ...
133     'MaxEpochs', nn.get('EPOCHS'), ...

```

④ is a query that collects all the target values from all data points.

⑤ trains the regressor with the defined dataset.

⑥ and ⑦ firstly extract the inputs and targets with the corresponding format.

⑧ defines the neural network architecture with user specified number of neurons and number of layers.

⑨ defines the neural network training options.

```

133         'Shuffle', nn.get('SHUFFLE'), ...
134         'Plots', nn.get('PLOT_TRAINING'), ...
135         'Verbose', nn.get('VERBOSE') ...
136     );
137
138     % train the neural network ⑩
139     value = trainNetwork(inputs, targets, nn_architecture, options);
140 end

```

⑩ trains the model with those parameters and the neural network architecture.

Code 3: NNRegressorMLP element props. The props section of generator code for `_NNRegressorMLP.gen.m` defines the properties to be used in `NNRegressorMLP`.

```

1 %% iprops!

15 %%%% idefault!
16 true
17
18 %% iprop!
19 INTERRUPTIBLE (gui, scalar) sets whether the comparison computation is
    interruptible for multitasking.
20 %%%% idefault!
21 .001
22
23 %% iprop! ②
24 FEATURE_IMPORTANCE (query, cell) evaluates the average significance of each
    feature by iteratively shuffling its values P times and measuring the
    resulting average decrease in model performance.
25 %%%% icalculate!
26 % fi = nn.get('FEATURE_IMPORTANCE', D) retrieves a cell array containing
27 % the feature importance values for the trained model, as assessed by
28 % evaluating it on the input dataset D.
29 if isempty(varargin)
30     value = {};
31     return
32 end
33 d = varargin{1};
34 P = varargin{2};
35 seeds = varargin{3};
36
37 inputs = cell2mat(nn.get('INPUTS', d));
38 if isempty(inputs)
39     value = {};
40     return
41 end
42 targets = cell2mat(nn.get('TARGETS', d));
43 net = nn.get('MODEL');

```

① defines the number of neuron per layer. For example, [32 32] represents two layers, each contains 32 neurons.

② is a query that calculates the permutation feature importance. Note that, other neural network architectures, such as convolutional neural network, have other technique to obtain feature importance.

```

44
45 number_features = size(inputs, 2);
46 original_loss = crossentropy(net.predict(inputs), targets);
47
48 wb = braph2waitbar(nn.get('WAITBAR'), 0, ['Feature importance permutation
...']);
49
50 start = tic;
51 for i = 1:1:P ④
52     rng(seeds(i), 'twister')
53     parfor j = 1:1:number_features ⑤
54         scrambled_inputs = inputs;
55         permuted_value = squeeze(normrnd(mean(inputs(:, j)), std(inputs(:, j)
)), squeeze(size(inputs(:, j)))) + squeeze(randn(size(inputs(:, j))))
+ mean(inputs(:, j));
56         scrambled_inputs(:, j) = permuted_value;
57         scrambled_loss = crossentropy(net.predict(scrambled_inputs), targets
);
58         feature_importance(j) = scrambled_loss;
59     end
60
61     feature_importance_all_permutations{i} = feature_importance /
original_loss;
62
63     braph2waitbar(wb, i / P, ['Feature importance permutation ' num2str(i) '
of ' num2str(P) ' - ' int2str(toc(start)) '.' int2str(mod(toc(start),
1) * 10) 's ...'])
64     if nn.get('VERBOSE')
65         disp(['** PERMUTATION FEATURE IMPORTANCE - sampling #' int2str(i) '/'
' int2str(P) ' - ' int2str(toc(start)) '.' int2str(mod(toc(start), 1) *
10) 's'])
66     end
67     if nn.get('INTERRUPTIBLE')
68         pause(nn.get('INTERRUPTIBLE'))
69     end
70 end
71
72 braph2waitbar(wb, 'close')
73
74 value = feature_importance_all_permutations;

```

④ and ⑤ iteratively shuffle the feature values from any given dataset P times and measuring the resulting average decrease in model performance.

Code 4: **NNRegressprMLP element tests**. The tests section from the element generator `_NNRegressprMLP.gen.m`. A test for creating example files should be prepared to test the properties of the data point. Furthermore, additional test should be prepared for validating the value of input and target for the data point.
